Heat transfer principle. A heat sink transfers thermal energy from a higher temperature device to a lower temperature fluid medium. The fluid medium is frequently air, but can also be water, refrigerants or oil.

Sensible heat. The first class called sensible heat uses the specific heat capacity to store thermal energy. Unfortunately, because the specific heat capacity of most materials is generally of two orders of magnitude lower than its latent heat, sensible heat storage is obsolete in a thermal management system.

The viscosity of a fluid is the measure of its resistance to gradual deformation by shear stress or tensile stress. For liquids, it corresponds to the informal concept of "thickness": for example, honey has a higher viscosity than water.
